**DEPARTMENT OF RADIOLOGY**  
**MRI RIGHT SHOUDLER**

---

Clinical history : recurrent shoulder dislocation (> 10 episodes), unable to lift the arm.

**FINDINGS :**

- Bony defect seen in the posterosuperior aspect of humeral head (Hillsach's lesion) showing
  - associated marrow contusion,
  - percentage of Hillsach's defect –8 % of surface area of humeral head,
  - span of deg circumference
  - Hill sach's index: 1.9
- Bankart's lesion noted showing :
  - Labral tear from 1-6 o'clock position (coracoid considered as being in 1 o'clock anterior position)
  - normal posterior glenoid labrum.
  - Bony Bankart lesion with associated bony defect
  - percentage of Bankart defect – 14 % of surface area of glenoid surface.
  - Glenoid index: 1.7
- Supraspinatus, infraspinatus, subscapularis and teres minor muscle and the tendons appear normal in morphology and signal intensity.
- Biceps tendon is within the bicipital groove and appear normal.
- Deltoid muscle is normal.
- Acromion process is type II in morphology

**IMPRESSION :**

**Recurrent dislocation of the shoulder**

- **Hill sach's defect.**
- **Bony Bankart with labral tear.**
- **Off track lesion.**
- **Intact rotator cuff.**
